

Reasons for failure

Google Glass ultimately failed due to a combination of factors, including a high price tag, privacy concerns, limited functionality, and a lack of clear use cases. The device was also seen as bulky and potentially awkward, and its early release was not fully polished, leading to complaints about battery life and other issues.

GLASS

Reasons for failure

Price :

At \$1,500, Google Glass was expensive and not easily accessible to the average consumer.

Privacy Concerns:

The device's built-in camera raised concerns about potential privacy violations, especially in public spaces.

Limited Functionality:

While it offered some interesting features like capturing photos and videos, it didn't offer enough to justify its high price or replace the convenience of smartphones

Lack of Clear Use Cases:

Google struggled to define a clear and compelling purpose for the device, making it difficult to attract mainstream interest.

GLASS

Design and Unpolished Product:

The design was seen as bulky and not particularly appealing, and the early release lacked the polish and refinement expected of a consumer-ready device.

Battery Life and Other Issues:

Users reported issues with short battery life, slow upload times, and spotty voice control, further hindering its usability.

Marketing and Launch:

Google's marketing efforts and product launch strategy were also criticized for not fully capitalizing on the hype and for failing to adequately address user feedback

Key assumptions made by Google

1. **Social Acceptance of Wearable Tech:**

- Google assumed users would be comfortable wearing visible, camera-equipped smart glasses daily. This overestimated public readiness, especially given privacy and social concerns.

2. **Value of Hands-Free Convenience:**

- Google believed features like instant access to information and easy photo/video capture would outweigh issues like high cost, privacy fears, and social awkwardness. However, these benefits didn't convince most consumers.

User Interview

Name:- Utkarsh Choudhary

Designation:- Sr. AI/ML Developer

Works At - Earnst & Young

Phone :- 8707438732 **Email:-** utkarsh.ut300@gmail.com

Questions asked during the interview:

Q.1- Are you a Tech Enthusiast who is keen to wear wearable tech?

Ans- Yes.

Q.2- Have you heard about the Google Glass? If so, what do you remember or what were your initial impressions?

Ans- Yes. I remember the google glasses and I find them very finicky. It was indeed a great innovation but failed to capture the needs of the users. All the more it had societal and privacy concerns about people being recorded without consent, stalking and harassment.

GLASS

Jobs To Be Done

Job 1

- **Situation:** I'm walking around a new city,
- **Motivation:** and I need to find information about places nearby quickly,
- **Expected Outcome:** so I can navigate easily and explore effectively without constantly looking at my phone.

Job 2

- **Situation:** I'm experiencing a memorable moment,
- **Motivation:** I want to capture a photo or video of exactly what I'm seeing, right when it happens,
- **Expected Outcome:** I can preserve the memory automatically and share it easily later.

PERSONA

USER DESCRIPTION:

Rishi Sharma, a 22-year-old visually impaired student in Delhi, India, deeply values accessible and efficient technology. As a student, the scarcity of Braille content fuels his desire for knowledge. Navigating daily life and accessing visual information often require juggling multiple smartphone applications, each with its own learning curve. This complexity leads Rishi to yearn for a single, intuitive gadget that seamlessly integrates navigation, accessibility features, and visual assistance, eliminating the frustration of navigating disparate interfaces. He seeks a solution that understands his needs as a blind user from the ground up.

BEHAVIORS AND PREFERENCES:

Rishi, a visually impaired student in Delhi, prioritizes audio-centric, efficient technology. Frustrated by juggling inaccessible apps for navigation and visual information, he seeks a single, intuitive gadget. He values seamless audio navigation with obstacle detection, accurate audio object/text recognition, and consistent, customizable controls, desiring a solution designed for blind users to enhance his independence and learning.

NAME:	RISHI
AGE:	22 years old
OCCUPATION:	Student
LOCATION:	Delhi

Pain Points

- Navigation
- Traffic
- Reading Accessibility

Goals and Needs

- Visual to Audio Descriptiveness
- Reliability
- Information Accessibility

MOTIVATIONS:

- Trust
- Accessibility
- Voice Navigation

Customer Journey

Stages	Need	Awareness	Interest/Exploration	Daily Use & Public Interaction	Reflection/Outcome
Activities	Users have needs for quick info, hands-free tech, or effortless capture in certain situations (often unmet by phones).	User hears about a new, futuristic wearable from Google.	User actively seeks information about what Glass is and what it can do.	User attempts to integrate Glass into their daily routine, wearing it in public and interacting with others.	User evaluates their overall experience with Glass and its usefulness in their life.
Touchpoints	Existing pain points with current devices (phone in pocket, missing moments).	Tech news sites, social media, viral videos (e.g., skydiver demo), word of mouth.	Google's official website, tech reviews, demo videos, developer information, articles.	The Google Glass hardware in various environments, interactions with friends/strangers, specific apps ("Glassware"), Wi-Fi/Bluetooth connectivity.	Personal thoughts, conversations about Glass, comparing Glass to other devices, drawer/shelf where Glass ends up.
Thoughts	"It's annoying having to grab my phone for every little thing." "I wish I could just take a picture of that right now."	"Wow, smart glasses! This looks like the future." "Google is building this?"	"So it shows info in front of your eye... and takes pictures with your voice?" "How would I actually use this?" "It's called 'Explorer' edition... seems limited release."	"People are looking at me weirdly." "Do they think I'm recording?" "Someone called me a 'Glasshole'." [FRICTION POINT - Social/Privacy] "The battery drains so fast." [FRICTION POINT - Usability/Battery] "This feels awkward to wear." "It's easier to just use my phone." [LOSS POINT]	"That was an interesting experiment." "It didn't really fit into my daily life." "The privacy thing was a major issue." "It wasn't practical enough for the price." "I rarely use it anymore."
Mood	😞 Frustrated, 💡 Seeking a better way	😄 Excited, 😐 Curious	✨ Interested, 😐 Considering, researching	😞 Self-conscious, 😞 Annoyed by reactions, 📱 Frustrated, 😞 Disappointed [Major Friction/Loss]	reflecting, 😐 Unsure, 😞 Disappointed, archived

Turnaround Strategy

- **Eliminating Visual Output Components:** A major cost saving can be achieved by removing hardware dedicated to visual displays, such as the micro-display projector and prism found in the original Google Glass. These are unnecessary since the intended users have visual impairments.
- **Prioritizing Audio as the Primary Interface:** Development efforts should concentrate on delivering information through high-quality audio output, perhaps using discreet earbuds or bone conduction technology. Sound would be the main way the device communicates with the user.
- **Collaborating with Support Organizations:** Partnering with non-profit organizations and government agencies focused on assisting the blind and visually impaired can open avenues for funding, potential subsidies for users, or opportunities for bulk purchases by these groups.
- **Considering Direct Sales:** Selling the device directly to consumers could help reduce the final cost by cutting out markups typically added by retail intermediaries.
- **Offering Optional Premium Services:** While the core device should be affordable, consider introducing optional subscription-based services for advanced features (e.g., access to human assistance for complex visual interpretation, more sophisticated AI capabilities). This could provide a revenue stream to help offset the initial hardware cost.
- **Addressing Privacy Concerns:** Learning from the original product's failure, our turnaround strategy prioritizes user privacy and data security by strictly adhering to relevant IT acts and data protection laws (e.g., India's IT Act, 2000), implementing privacy-by-design principles, ensuring data minimization, transparency, and user control, and building trust through responsible data handling.

Testing the hypothesis

A core strategy for testing and promoting the success of our solution involves strategic collaboration with government agencies and organizations dedicated to the welfare of the specially abled; leveraging their existing engagement with the target community for conducting focus groups and gathering qualitative feedback, ensuring alignment with established privacy regulations and ethical guidelines, and exploring potential access to allocated government budgets, subsidies, and support programs which can facilitate user adoption and scale.
